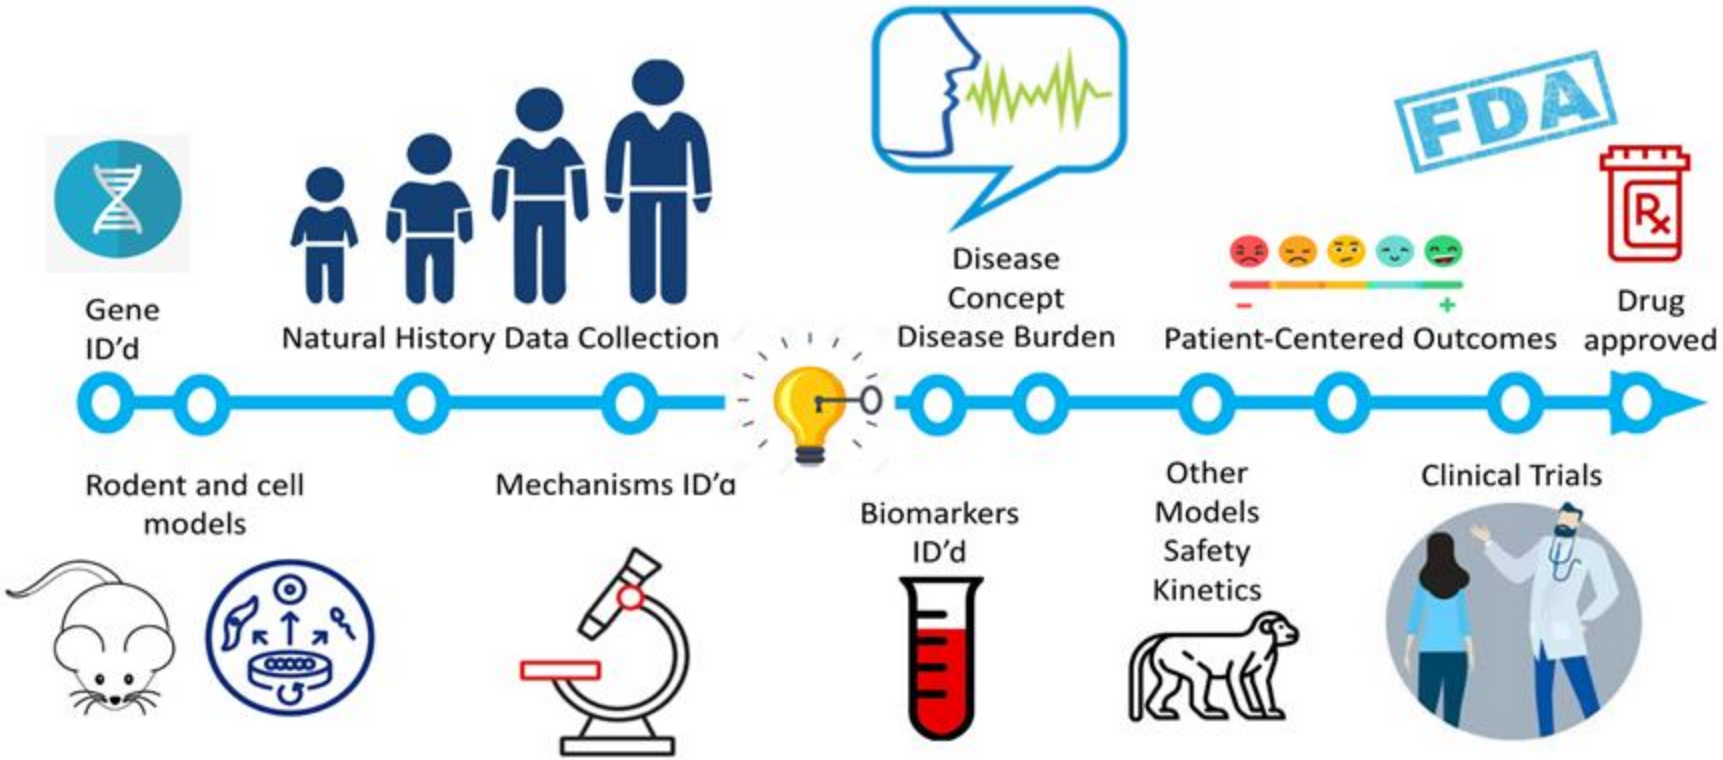
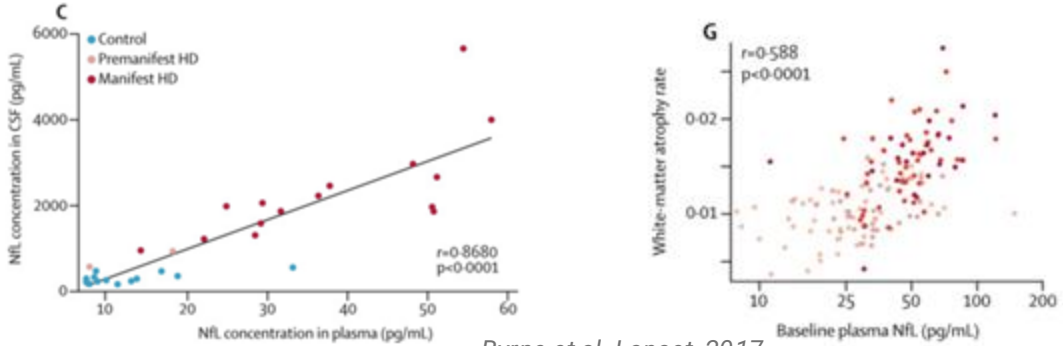
Drug development for a rare, genetic neurodevelopmental disorder



- A **biomarker** is an objective measure which can be used to predict *disease status*, *progression* and/or *response to treatment*
  - mRNAs, miRNAs, epigenetics, proteins, metabolites, microbiota
  - Biologics
    - Found in biofluids: cerebrospinal fluid, blood, urine, saliva, stool
    - Example: CSF and plasma NfL in HD



Byrne et al. Lancet, 2017.

- **Limited access to patient samples with rare diseases**

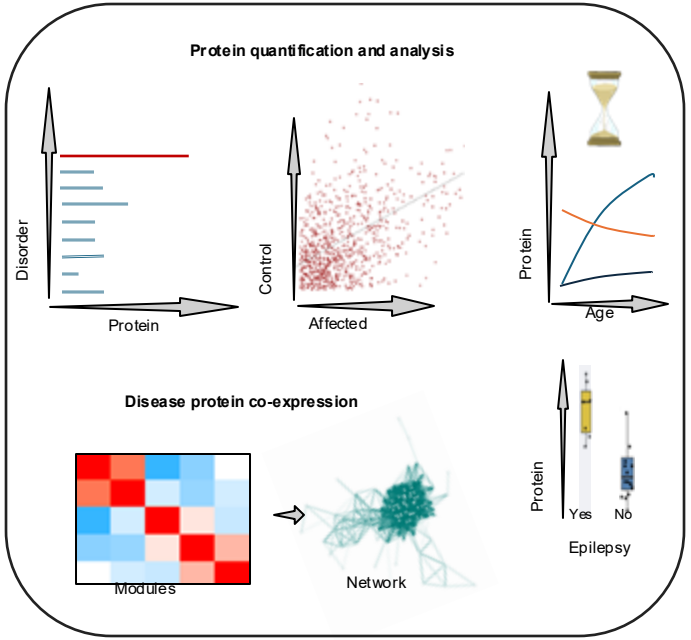
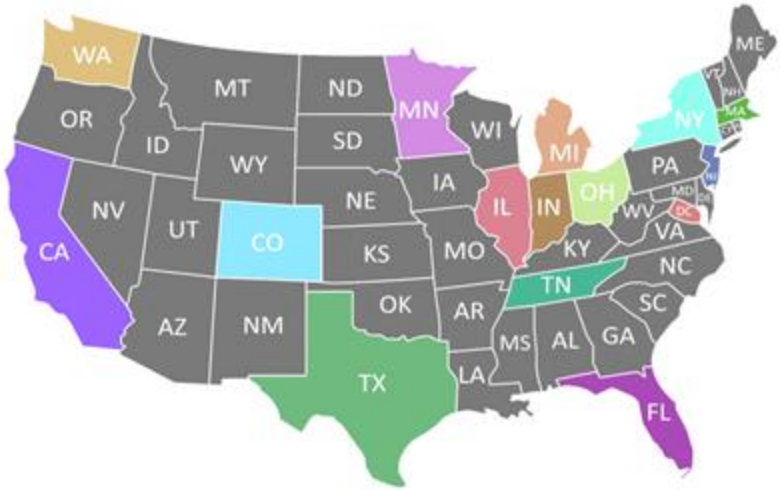
Phenotypic Assessments



Sample Collection

- 19 Family Conferences in 2023
  - Fly research team + pediatric phlebotomists
  - Collect blood -> plasma on-site

- Home visits
  - Contract with mobile phlebotomists
  - Coordinate home visits



- In collaboration with clinical labs

Current "Conclusions" / Next Steps

- Several proteins enriched across *several disease groups*
- Identify appropriate phenotypic measures to use for clinical severity
- More cross-sectional plasma samples to validate initial findings (GFAP, SAA1/2)
- Longitudinal samples
- Validate plasma findings in cerebrospinal fluid

- **MED13L/ CTNNB1:** preliminary findings suggest altered expression of Wnt signaling in plasma -> validate in additional cross-sectional samples
